

**Internet security review** sites can provide useful information to help you select your internet security software. However, it is not easy to judge which sites are useful or not. There are a number of "review sites" available online but the quality of the information they provide varies enormously. Here are some answers to common FAQs to help you judge whether an **internet security review** site is any good.

1) What types of sites should I be wary of and why?

You need to be wary of review sites with very little meaningful content or insight of the product being reviewed. Affiliates use review site formats to sell products they are promoting. Usually affiliates will push products with the highest commission regardless of whether the product is any good. This is not to say that all affiliate sites provide poor reviews.

In order to judge the quality of an affiliate site you need to take a look around. If the product review is only the content on the site and there is no other meaningful content then it is probably an affiliate sales site. If the site provides good content in conjunction with the review then the review is probably decent too. Also be aware how you got to the site. If you clicked on an advert or sponsored result somebody is paying for your click and therefore need to make sales.

2) What internet review sites should I trust?

Chances are the sites belonging to quality PC publications will contain good reviews you can trust. Take a look at PC Magazine's or Computer Shopper's websites. It is also likely that sites ranked highly on Google's search results will provide a good review as Google considers these sites an "authority." Search results can be manipulated but if you click on a site and the content looks good and of high quality then it is likely the review would be good too. The final place you can look is for recommendation at popular computer forums like DaniWeb or ComputerHope.

3) What should I look for in a good review?

A good review will include both positive and negative points about the given product. A balanced review is key to making a good recommendation. When you read a good review you should be able to get a good feel for the features and capability of the product.

4) What other tips should I follow to make a good purchase decision?

One of the most important tips is to look for consistency. If a product is indeed good then it should be highly ranked in a number of different, independent reviews.

These tips should help you judge whether a site offers a good **internet security review**.

## Maintaining Internet Security

The World Wide Web poses many threats to users all over the world. One of the main reasons for this is that the Internet is just a fountain of valuable information that people can access. Since the world of the Internet technically runs on a series of codes, then one only really needs to figure out how to work his way through this code to get any information he wants. The name of this game is hacking.

Hacking is one of the major threats the Internet poses. It is mainly done to gain valuable and supposedly inaccessible information from users. These confidential pieces of information usually include a person's identity records or online transaction records. When in the wrong hands, they can cause tremendous damage to the owners of this information. For example, through hacking, unauthorized users may be able to obtain a person's credit account information and use it to conduct illicit online purchases. This can indeed be very detrimental for the owner of the information and repercussions may take some time to be repaired.

It is then important, for all Internet users to protect not only their information, but also their own operating system from these dangerous Internet threats.

There are many ways to maintain one's Internet Security. The most common one is the use of anti-virus and anti-spyware software. Using these prevent unsolicited malware (viruses, spyware and adware) from invading one's operating system, steal private information and deliver them to a source. Yes malware, especially spyware are designed to work this way. If not, they affect the computer's performance by slowing it down or tampering with the files.

Depending on how much security one needs, the user may employ the use of a combination of security strategies. For example, companies that also conduct transactions online tend to take the extra mile with Internet protection. This is to ensure their customer's welfare and also for their own. Companies usually use a combination of all the anti-malware software, firewall systems and many more.

Many Internet security software are being offered online. These different software focus on different aspects of Internet security. There are also others that offer all-in-one protection. One such software is the PC tools Internet Security Suite. This software is an award-winning Internet protection software that has the combination of anti-virus, anti-spyware, spam protection and firewall abilities. The following are some of the things it offers.

- It blocks, removes and detects all sorts of malware. This includes deadly computer viruses like Trojans and worms, and it also includes spyware and adware.
- It also updates itself and your system to guarantee protection against the latest and most advanced threats.
- It prevents hackers and other unauthorized users from invading your system or network and obtaining your private information.
- It guarantees customer service and support for no charge at all.
- It filters your e-mail against spam or other unwarranted e-mails.

There are many other Internet protection software one can use. Whatever software one decides to use, it should be the one that best suits their needs.
